

Deploy Instructions - Orchestrator Agent

Status: READY FOR PRODUCTION DEPLOY

O Orchestrator Agent foi completamente corrigido e está pronto para deploy no Render!

Problemas Técnicos Resolvidos

- V LangGraph Schema Issues: Corrigido OrchestratorState com campos Optional
- Node Functions: Funções agora retornam Dict updates corretamente
- Graph Configuration: Removido nó inalcançável, StateGraph usando dict
- V Server Integration: Campo messages adicionado ao estado inicial
- V All Endpoints Working: /task e /status/{task_id} funcionando perfeitamente

🧪 Testes Locais Realizados

```
# 🔽 Graph Creation
Graph created successfully!
# 🚺 Task Execution
POST /task → {"task id": "6c4bde4b-f604-4151-b6c5-213d338ce308", "status": "running"}
# 🔽 Status Check
GET /status/6c4bde4b-f604-4151-b6c5-213d338ce308 → {"status": "completed"}
```

Deploy no Render

Opção 1: Deploy Automático via GitHub (Recomendado)

1. Conectar Repositório

- Acesse Render Dashboard (https://dashboard.render.com)
- Clique em "New +" → "Web Service"
- Conecte o repositório: https://github.com/paranhospr/web-next
- Branch: main (após merge do PR #3)

2. Configuração Automática

- O Render detectará automaticamente o render.yaml
- Nome do serviço: orchestrator-agent
- Build Command: pip install -r requirements.txt
- Start Command: uvicorn app.server:app --host 0.0.0.0 --port 8080

Opção 2: Deploy Manual

1. Criar Web Service

- Runtime: Python
- Build Command: pip install -r requirements.txt
- Start Command: uvicorn app.server:app --host 0.0.0.0 --port 8080

🔑 Variáveis de Ambiente Obrigatórias

Configure estas variáveis no painel do Render:

Essenciais

```
AGENT API KEY=your-secret-api-key-here
GITHUB TOKEN=ghp your github token here
GITHUB OWNER=paranhospr
GITHUB REPO=web-next
```

Integrações (Configure conforme necessário)

```
# Render Deploy Hooks
RENDER DEPLOY HOOK API=https://api.render.com/deploy/srv-your-api-service-id
RENDER DEPLOY HOOK WEB=https://api.render.com/deploy/srv-your-web-service-id
# Cloudflare DNS
CLOUDFLARE API TOKEN=your-cloudflare-api-token
CLOUDFLARE ZONE ID=your-cloudflare-zone-id
# Supabase Database
SUPABASE URL=https://your-project.supabase.co
SUPABASE_SERVICE_ROLE=your-supabase-service-role-key
# Google Calendar (Service Account)
GOOGLE_PROJECT_ID=your-google-project-id
GOOGLE CLIENT EMAIL=your-service-account@your-project.iam.gserviceaccount.com
GOOGLE_PRIVATE_KEY="----BEGIN PRIVATE KEY-----\nYour private key here\n----END
PRIVATE KEY----\n"
GOOGLE CALENDAR ID=your-calendar-id@group.calendar.google.com
```

Opcionais (Valores padrão funcionam)

```
AUTO FIX=false
MAX FIX ATTEMPTS=3
ENABLE HUMAN GATE=false
ENVIRONMENT=production
PORT=8080
DATABASE PATH=/tmp/orchestrator.db
VERIFY TIMEOUT=30
VERIFY MAX RETRIES=3
HUMAN GATE TIMEOUT=300
HUMAN GATE AUTO APPROVE=false
```

🧪 Testando o Deploy

Após o deploy, teste os endpoints:

1. Health Check

```
curl https://your-service.onrender.com/
```

2. Task Execution

```
curl -X POST https://your-service.onrender.com/task \
  -H "Content-Type: application/json" \
  -H "Authorization: Bearer your-secret-api-key-here" \
  -d '{"type": "verify", "targets": ["https://httpbin.org/status/200"]}'
```

3. Status Check

```
curl -H "Authorization: Bearer your-secret-api-key-here" \
  https://your-service.onrender.com/status/{task_id}
```

📋 Próximos Passos

- 1. Merge PR #3 para branch main
- 2. Deploy no Render usando as instruções acima
- 3. Configurar variáveis de ambiente no painel do Render
- 4. Testar endpoints conforme exemplos acima
- 5. Integrar com seus sistemas usando a API REST

© URL Final

Após o deploy, sua URL será algo como:

https://orchestrator-agent.onrender.com

🔒 Segurança

- 🗸 Autenticação Bearer Token obrigatória
- Validação de entrada com Pydantic
- V Logs estruturados para monitoramento
- <a> Tratamento de erros robusto
